

- The parameters from IBM Watson IOT platform need to be sent to web application. The flow diagram can be generated by NODERED. Parameters that are sent for the web application are temperature, humidity, Object temperature and also weather information generated by Open weather API. This weather info can be processed by using HTTP request and response.
- This need to be implemented through flowcharts as given below:

- The parameters that are analysed need to be represented in dashboard. Along, with these extra parameters can also be sensed.
